

contain an assessment of the amount of grassland-steppe in good and poor quality, nor is the condition mapped or described spatially.

While we have not been to the project site, our considerable experience in the region suggests that the low cover of sagebrush species in the area mapped as grassland is probably because it burned more recently than adjacent areas that were mapped as shrub-steppe. If that is the case, the distinction between shrub-steppe and grassland-steppe (with patches of sagebrush) may hold little meaning. That is, the distinction may not necessarily point to differences in quality or diversity of habitat in the long-term, although it is convenient to map areas with shrub separately from areas without because it is a feature visible on an aerial photo. Some of the better quality habitat in the area may in fact be in the steeper areas, particularly areas that have Idaho fescue. The presence of cheatgrass, even its dominance, and the lack of shrubs should not automatically dismiss the vegetation type from an area's importance on a landscape scale. Please review this matter carefully. Rex Crawford, ecologist with the Washington Natural Heritage Program, may be able to assist in clarifying this issue.

The second major problem we have with the Draft EIS is the inadequacy of the proposed mitigation measures for disturbances to native habitat. As proposed, there is the potential for net loss of habitat, with protection afforded to the mitigated sites only for 'the life of the project.' It is not acceptable that mitigation for damage to steppe habitat, particularly on publicly owned land, be only temporary. If it is completely unavoidable, habitat destruction or degradation on public land should be mitigated with acquisition of permanently protected land. We suggest that funds gained for mitigating project disturbances be at least partially channeled to the Trust Land Transfer Program (DNR), or other such program, for the permanent protection of habitat on publicly owned land.

Finally, we suggest that heavy fines be imposed for disturbance to sites flagged as sensitive, such as for rare plants, habitat, wetlands, etc. during construction activities. Driving machinery and being involved with construction makes it difficult many operators, working in a different scale and time frame, to have a balanced appreciation of the habitat they are impacting. Levying fines may make it easier for operators to pay close attention to the impact of their actions.

Please feel free to contact us with any questions or if we can clarify our comments.

Thank you,

Debra Salstrom and Richard Easterly

Please do not build wind mills on Rattlesnake. I have admired Rattlesnake for the nine years we have lived here. I do not want that profile distorted by an unnecessary project, especially one that will have to use public funds in order to be built.

Sincerely,
Pam Hedges
